

Increment executive case study

Decision: allocate a fixed promotion budget to maximize incremental contribution margin per eligible customer.

The smoke run estimates a conversion ITT of 0.0029; uncertainty is [-0.0033, 0.0091].

Business claim (synthetic illustration): at 50% of treat-all-small spend, capacity-aware allocation produces 2038 INR expected net value and 5.26 INR per eligible user above random (95% bootstrap interval 4.18 to 6.47).

Sensitivity: the advantage remains positive across the checked margin and capacity grid; see [reports/business_case_sensitivity.csv](#) for the exact scenarios.

Recommendation: validate economics and causal response in a geo-randomized pilot before treating the scenario as realized impact.
